and Geological Engineering

ABSTRACT

Recent improvements in computer modeling capabilities have produced several powerful, economical, three-dimensional groundwater flow and contaminant transport models. However, these models have outstripped our ability to supply the necessary subsurface characterization data from field and other methods.

Several integrating methods developed by sedimentologists can help define the most probable subsurface conditions based on limited exploration data. These methods ^{include} include several sedimentological facies modeling techniques. New three-dimensional geographic information system (GIS) can help model and visualize the resulting subsurface characterization data. Hydrogeologic properties can be estimated for defined litho-hydrologic units and supplied to appropriate numerical models to evaluate ground water flow and contaminant transport conditions.

These methods have been applied to a six-mile stretch of the South Platte River shallow alluvial aquifer near Platteville, Colorado. Numerous borehole and well logs were available. These were re-evaluated and combined with additional geophysical surveys to create two detailed stratigraphic profiles across the valley near the upstream and downstream test site boundaries. Facies architecture techni-

ques were used to infer sedimentary conditions between these observations and thus develop continuous cross-sections. The same techniques were then applied to project conditions, first downstream, and then upstream, to complete four intermediate transverse cross-sections and two longitudinal profiles. These steps produced twenty-one plates (maps, cross-sections, and longitudinal profiles) showing the spatial distribution of fine (clay) to coarse (sand and gravel) lenses. A three-dimensional visualization showing two merging channels demonstrated the utility of recently developed three-dimensional GIS technology. A three-dimensional finite element groundwater flow and contaminant transport model (CFEST) was used to evaluate the ground water conditions. Geohydrologic characteristics of the subsurface units were identified from the facies architecture data.

The numerical model readily produced a simulated water table which closely replicated the observed conditions and satisfied flow velocity constraints. These investigations show it is possible to obtain suitable estimates of the geohydrologic spatial trends from limited exploration data.

TABLE OF CONTENTS

	<u>Page</u>
1.0 INTRODUCTION	1
1.1 Purpose of Study	2
1.2 Scope of the Study.....	3
2.0 PREVIOUS THEORETICAL WORK	5
2.1 Heterogeneity Measurements in Hydrological Studies	5
2.2 The Definition of Geological Modeling ..	10
2.3 Geologic Modeling of Fluvial Systems ...	12
2.4 Facies Models in Fluvial Systems	13
2.5 Advances in Facies Modeling	19
2.6 Facies Modeling and Vertical Profiles ..	20
2.7 Fluvial Architectural and Computer Simulation of Facies Modeling in Three Dimensions	24
3.0 OTHER QUANTITATIVE METHODS FOR SUBSURFACE CHARACTERIZATION	35
3.1 Stochastic Versus Deterministic Modeling	36
3.2 Markov Process Models	37
3.3 Inverse Plume Analysis	39
4.0 RECENT DEVELOPMENTS IN THREE-DIMENSIONAL GEOLOGICAL DATA MODELING AND DISPLAY	41
4.1 Definition of True Three-Dimensional Systems	42
4.2 The Need for Three-Dimensional GIS for Subsurface Characterization	44
4.3 The Role for Three-Dimensional GIS	46
5.0 SELECTION OF FIELD TEST AREA	50
5.1 The Platteville Test Site	51
5.2 Previous Geologic and Hydrologic Studies	51
5.3 Bedrock Geology	55
5.4 Geologic Structure	58
5.5 Surficial Geology and Geomorphic Setting	58
5.6 General Hydrological Setting	77

TABLE OF CONTENTS (continued)

	<u>Page</u>
6.0 ACQUISITION OF BASIC DATA	79
6.1 Selection of Water Well Logs	79
6.2 Fort St. Vrain Nuclear Power Station Borehole Logs	81
6.3 Published Geologic and Hydrologic Data	86
6.4 Field Investigations	87
6.4.1 Geophysical Surveys	87
6.4.2 Resistivity Sounding Surveys	91
6.4.3 Resistivity Equipment and Field Procedures	94
6.4.4 Resistivity Data Interpretation..	97
7.0 INITIAL DATA EVALUATION	101
7.1 Bedrock Configuration Map	101
7.2 Landform and Surficial Geology Map	102
7.3 Water Table Elevation Map	102
7.4 Depth to Water Table Map	104
7.5 Creation of Initial Geologic Sections ..	105
8.0 DEVELOPMENT OF THREE-DIMENSIONAL SUBSURFACE CHARACTERIZATION MODEL	107
8.1 Selection of an Appropriate Sedimen- tological or Fluvial Regime "Model".....	107
8.2 Defining Lithohydraulic Units and the Scale of Heterogeneity	117
8.3 Further Interpretation of Cross- sections and Profiles	121
8.4 Coding the Final Cross-Sections	125
9. THREE-DIMENSIONAL COMPUTER VISUALIZATION	131
10. GROUND WATER FLOW MODELING	141
10.1 Selection of the Ground Water Model.....	144
10.2 Defining the Finite Element Mesh	145
10.3 Operation of the Program CFEST	148
10.4 Calibration of the Model	150
10.5 Computation of Flow Velocities	154
10.6 Assessment of Calibration Results	159
11. CONCLUSIONS AND RECOMMENDATIONS	163
11.1 Conclusions	163
11.2 Limiting Factors in This Study	166
11.3 Recommendations for Future Work	166

8-1	List of facies: Codes and elevations of the final cross-sections in the study area	128
10-1	Material permeability values used in the modeling.....	149
10-2	Selected simulated flux and velocity values for each lithology.....	159

ACKNOWLEDGMENTS

I would like to thank the sponsor of this degree and project, the High Education Ministry in Iraq. Also I would like to thank my research advisor, Dr. A.K. Turner and all the committee members: Dr. E. Poeter, co-advisor, Dr. K. Kolm of the Geology and Geological Engineering Department, Dr. J. Emerick of the Environmental Sciences and Engineering Ecology Department, Dr. P. Romig of the Geophysics Department, and Dr. K. Wiley of the Humanities and Social Sciences Department. Special thanks are due to the Geophysics Department in helping conduct the resistivity sounding surveys, and to Dr. T. Cross of the Geology and Geological Engineering Department for his assistance in the facies analysis chapter.

Appreciation is extended to the Colorado Geological Survey and the State Engineer Office, and especially to Mr. J. Romero of that office for his assistance in making the data available for this project.

I would also like to thank my colleague, Mr. Bill Wingle, for his immense help in the ground water modeling section.

T-3833

Finally, a special thank you to a special team for being extra supportive and extra patient while I finished this effort: my husband Fahad and both my children, Nihal and Ahmed.

The original material for this dissertation includes a significant number of oversized pages. The full text can be viewed by accessing the supplement file.
